

CraftWork

Ruby on Rails Application

By EmerThornbury 2015

This application allows the Admin person of a craft studio to login and set up the work for the coming days for Employees.

In a handcraft studio, finished products go through a number of different phases during their production cycle.

Products need to be set up by the Admin user, this can be done by csv file upload.

The different Phases that the Product goes through also need to be set up by the Admin user.

Users and employees are set up in the application, on initial login.

Then Workphases can be created with the required number of a Product in a specified Phase.

Employees can then login, see the list of Work to be done, choose a Phase by Id, and get a list of Products in that phase that they need to work on that day. They can update the totals when completed.

There is a default Admin user and Employee profile set up.

Created in Cloud9 and deployed via Heroku using Github for version control.

This is only the start of an idea.
